

FirstNet®

Quality of Service Priority and Preemption

Brian Kassa

Director of Technology Planning and Development

What are Quality of Service, Priority and Preemption (QPP)?

Hi, I'm
Fred!

- **Quality of Service** – Quality of Service is the overall performance of a telephony or data network, particularly as seen by the users of the network. To measure quality of service quantitatively, several related aspects of the network service are often considered, such as error rates, bandwidth, throughput, transmission delay, availability and jitter.
- **Priority** – Priority is a network capability that enables a user's application or usage of the network to take precedence over another user's application or usage of the network.
- **Preemption** – A network capability that permits authorized high priority traffic, e.g., coming from public safety or first responders, to take over resources assigned to lower priority traffic, e.g., private traffic.

Hi, I'm
Sam!

Yeah I know That, But What Does This Mean?

- Quality of Service, Priority and Preemption are very broad terms for a very large set of 3GPP features and functionality that FirstNet and its partner will utilize to ensure that the first responders have priority access to Band 14 when they need it and if the situation requires it, prioritization among first responders.

The FirstNet Network

Imagine a 6 Lane Highway (Only one direction shown here)

Every ~5 Miles of Highway Supports:

- 300-400 Active Users
- 1000's of Idle Users

Quality of Service

Quality of Service = Setting Cruise Control at 70 Miles Per Hour and driving 70 Miles Per Hour

Quality of Service = Setting Cruise Control at 70 Miles Per Hour and driving 70 Miles Per Hour

Exit

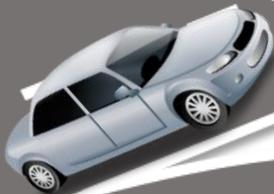

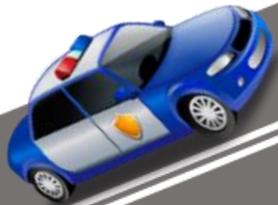

Entrance

Priority

Priority = This Lane
is Yours, everyone
else move over

ILLEGAL
TO CROSS
DOUBLE
WHITE
LINE

Priority = This Lane is Yours, everyone else move over

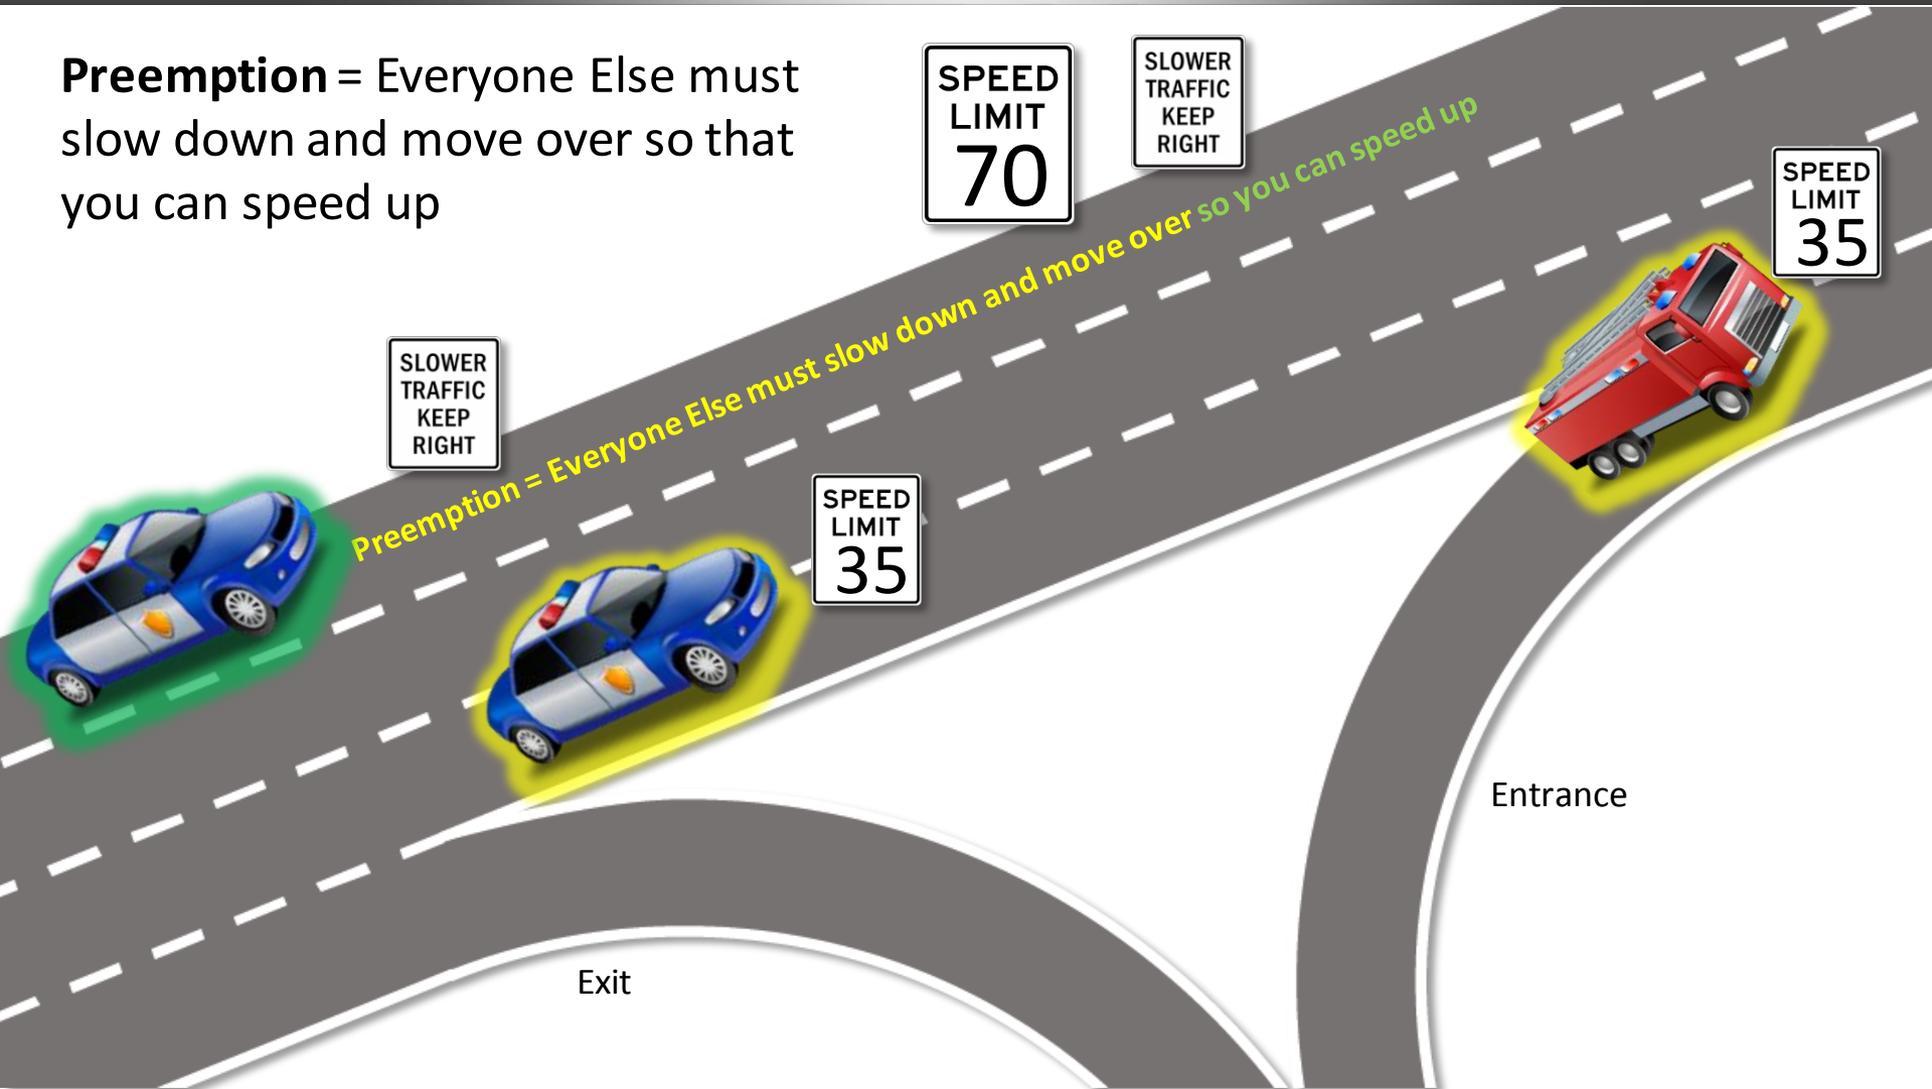

Exit

Entrance

Preemption: Among First Responders

Preemption = Everyone Else must slow down and move over so that you can speed up

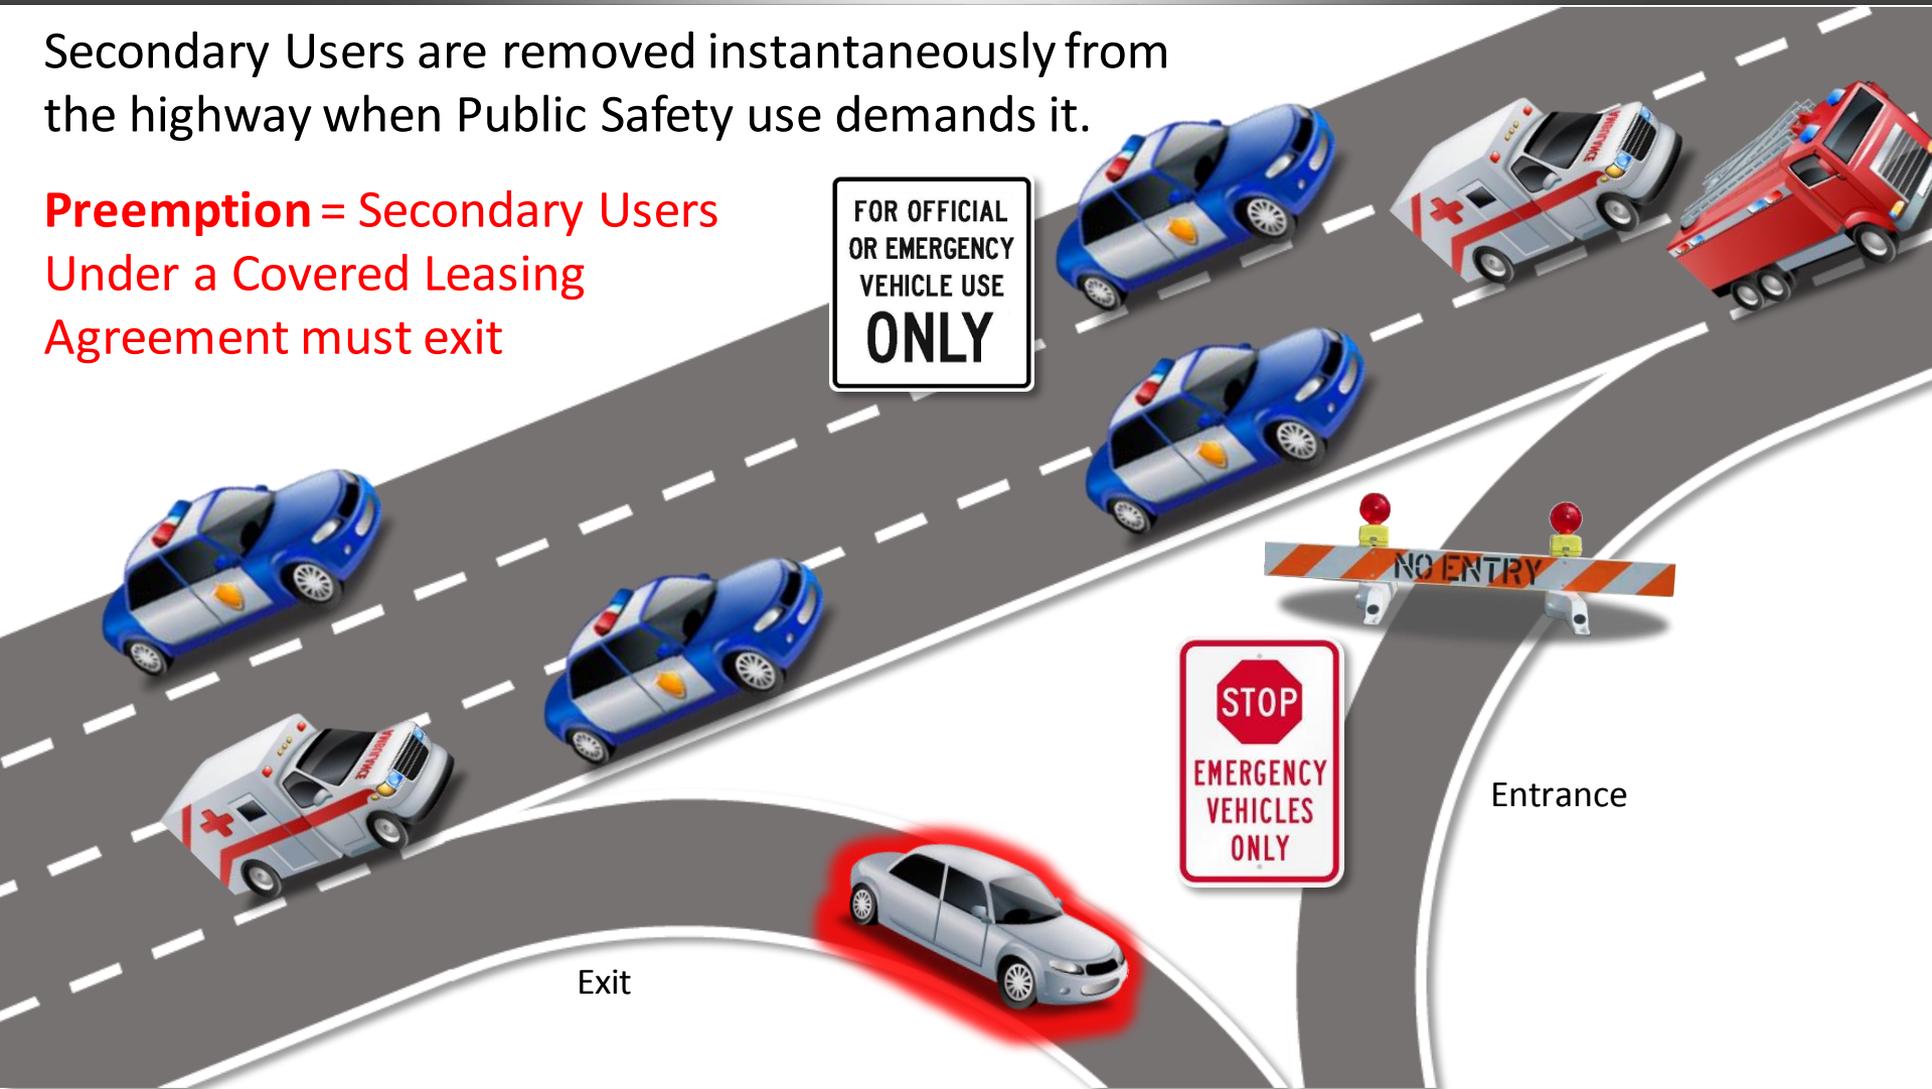

Preemption: Between Primary Users and Secondary Users Under a CLA

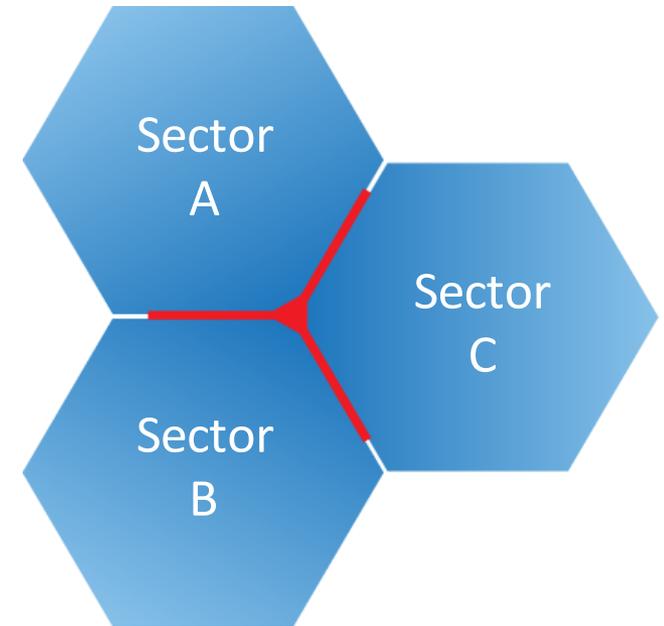

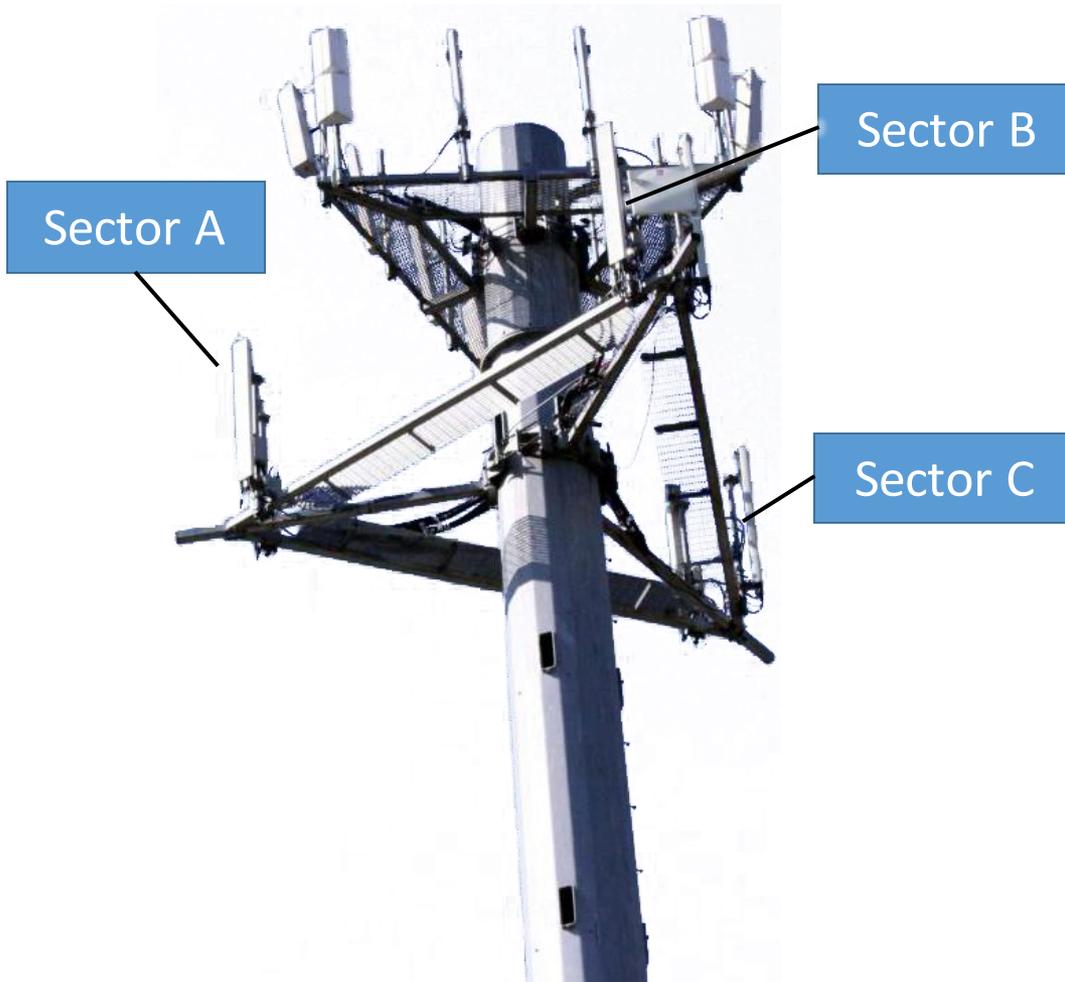

Secondary Users are removed instantaneously from the highway when Public Safety use demands it.

Preemption = Secondary Users Under a Covered Leasing Agreement must exit

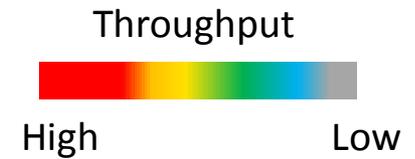

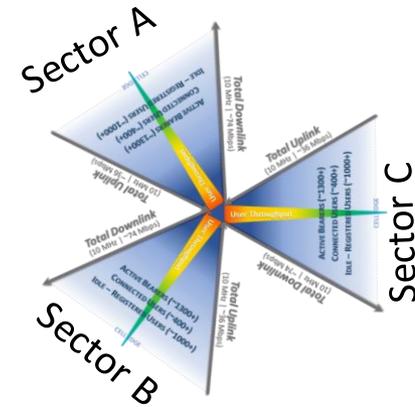

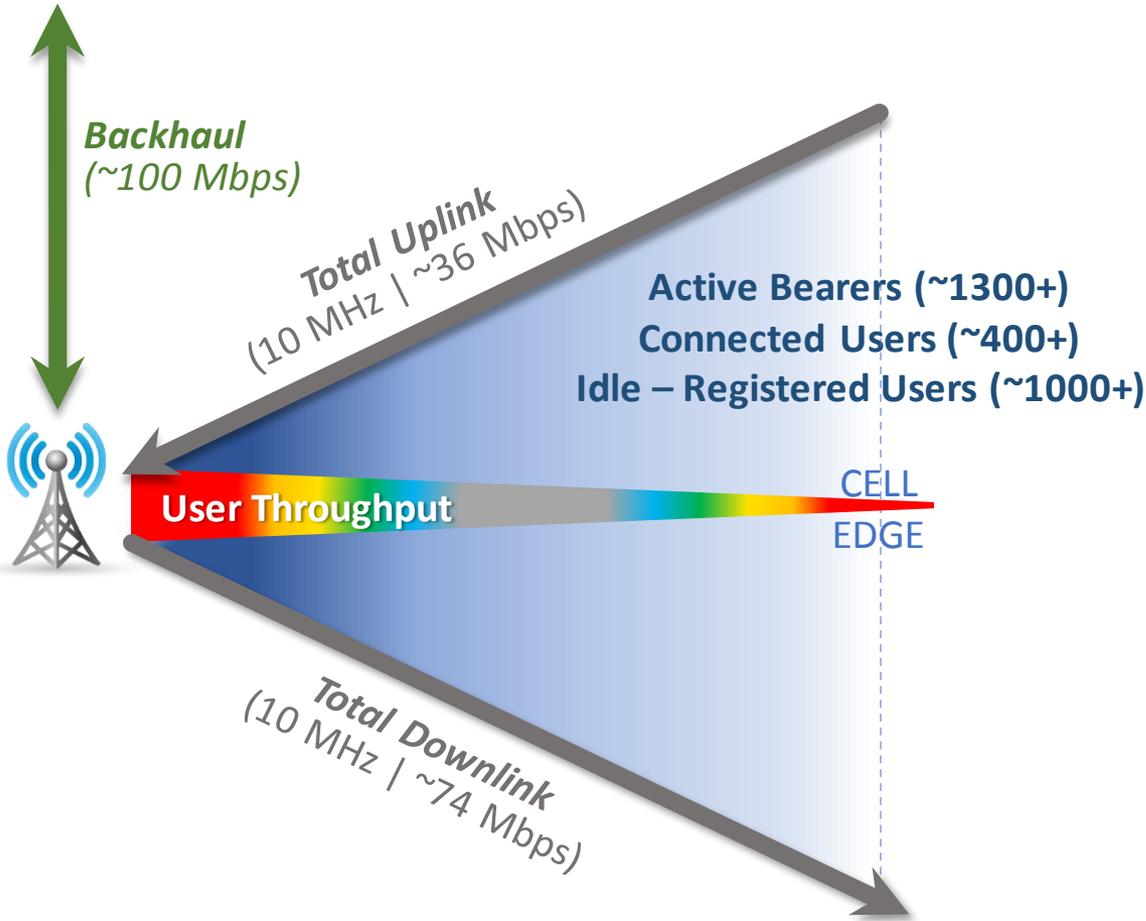

LTE is a “Cellular” Technology

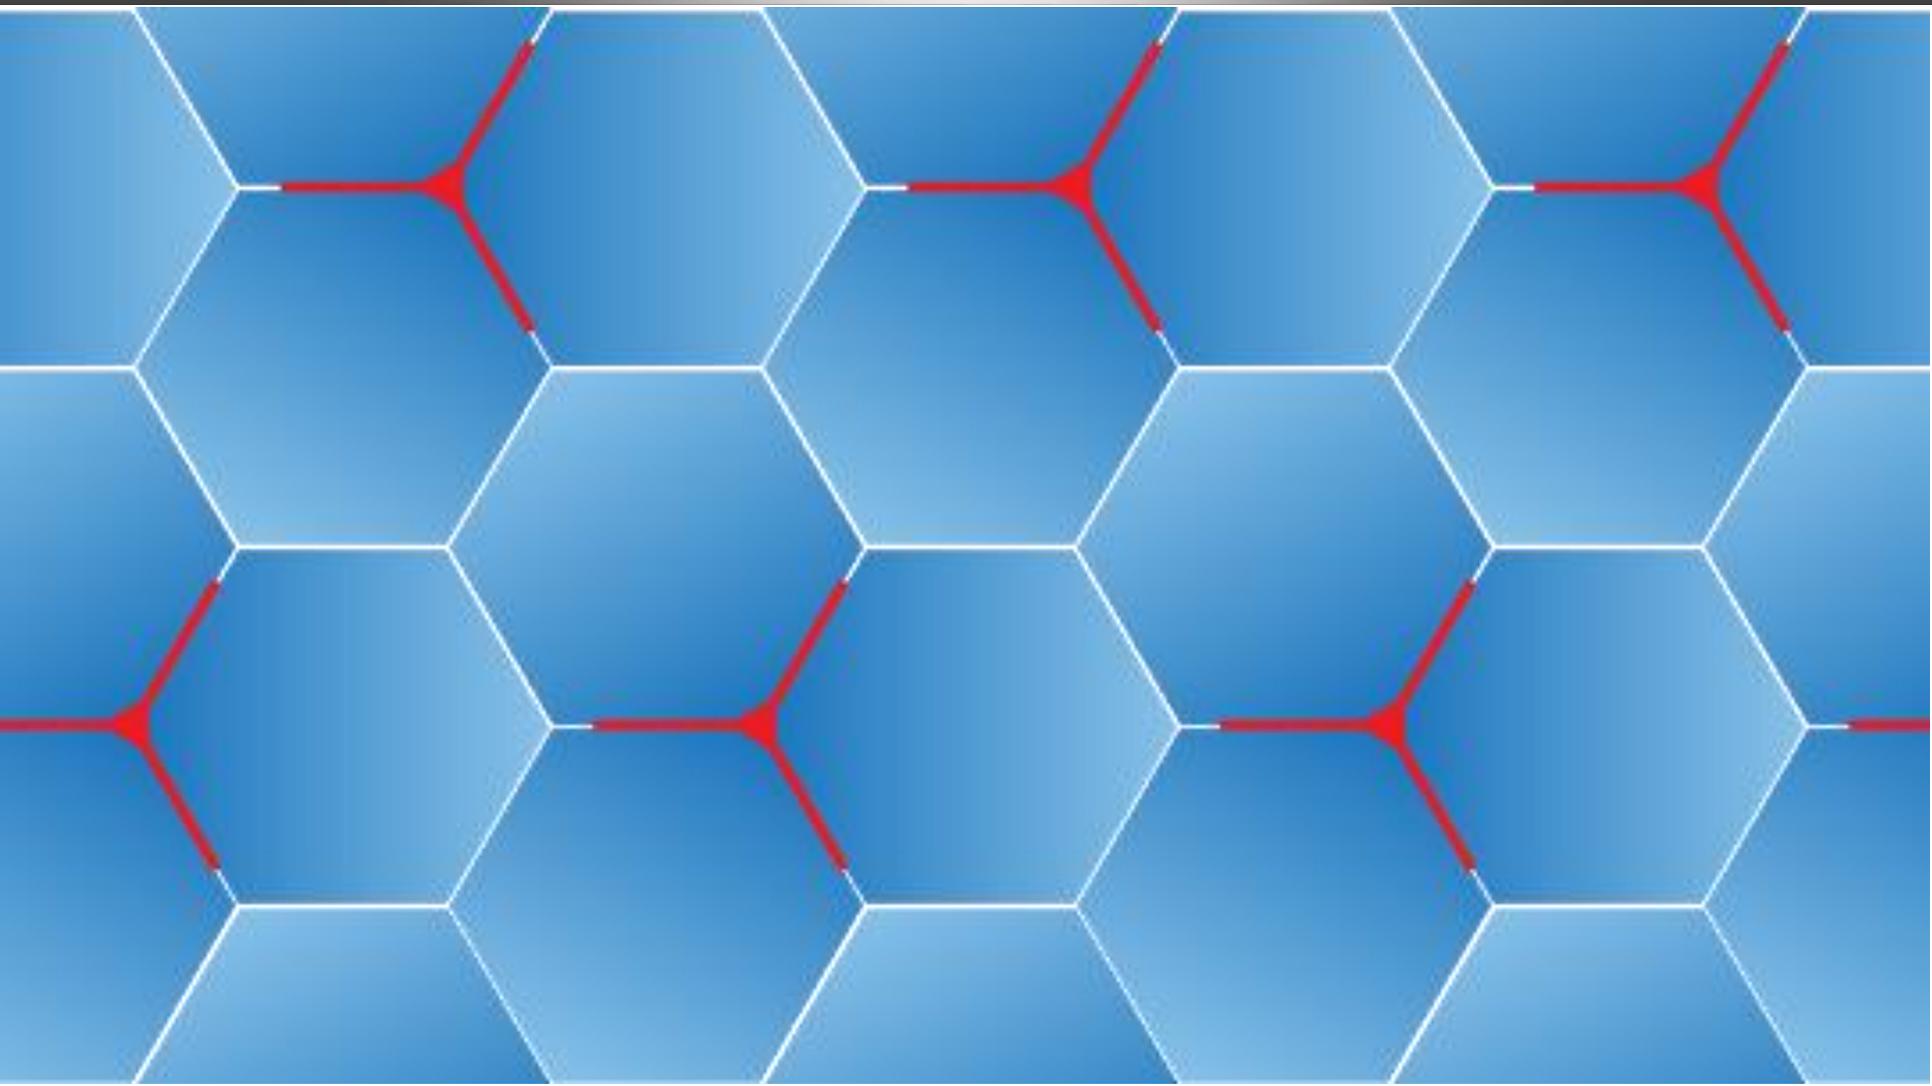

One “Cell” Site
With 3 Sectors

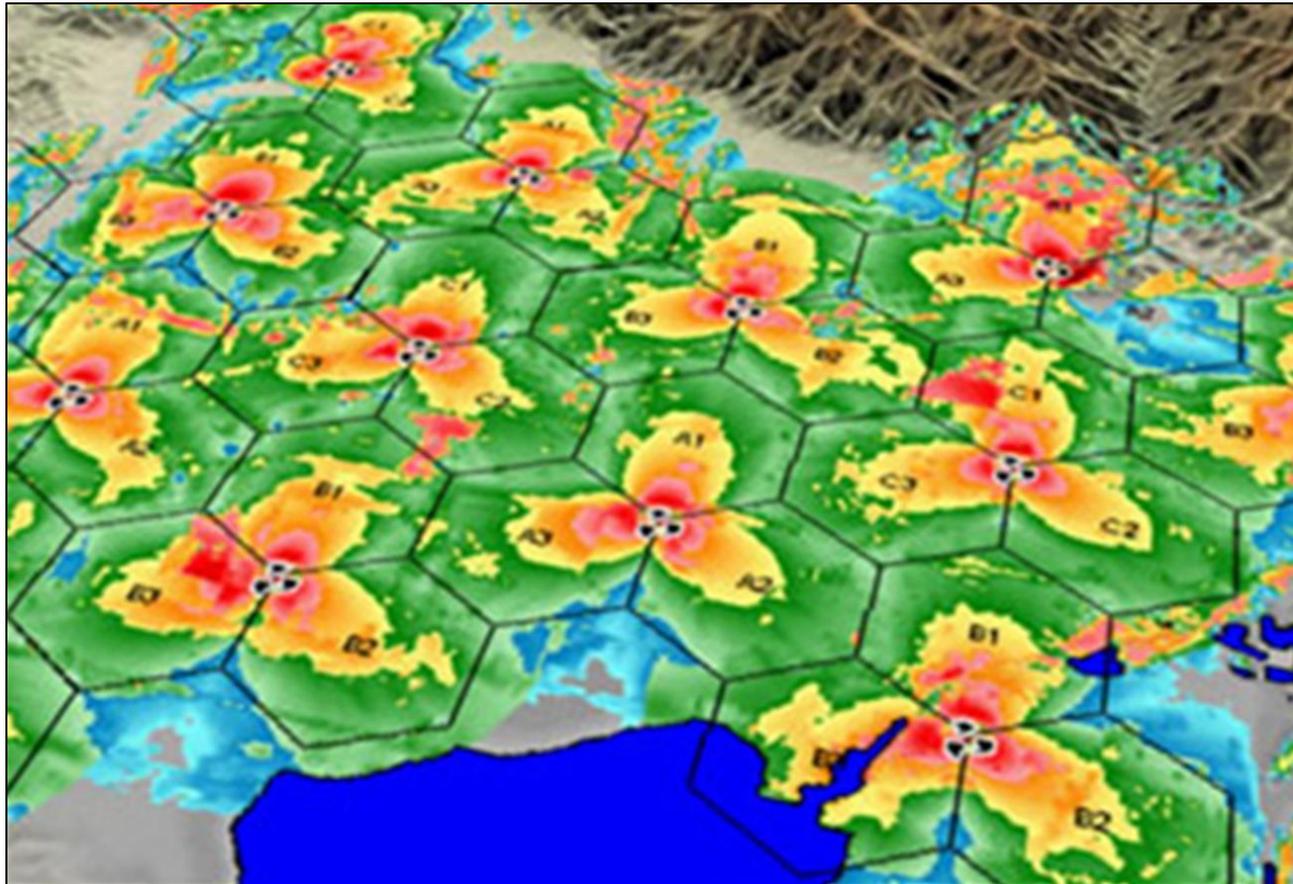

Cell-Sector Capacity

An Ideal Coverage Map

A Realistic Coverage Map

Excellent Signal

Very Good Signal

Good Signal

Acceptable Signal

Poor Signal

No Signal

Each Sector Can Be Independently Managed

Sector A
Load = 70%

Sector C
Load = 10%

Sector B
Load = 50%

QPP Control – Single Sector

QPP Control – Two Adjoining Sectors

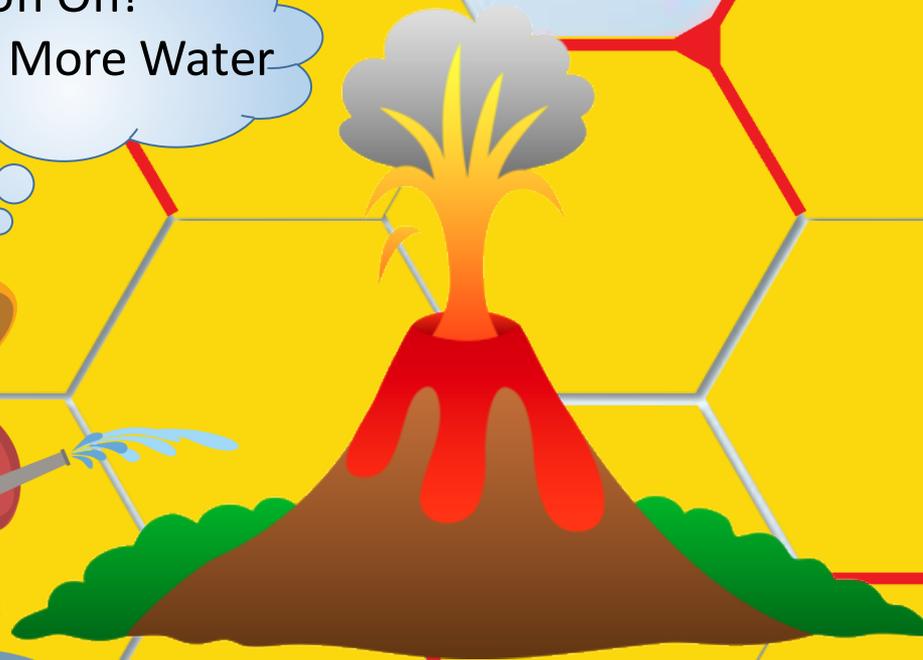

QPP Control – Three Adjoining Sectors

QPP Control – Multiple Cell Sites

Uh Oh!
I need More Water

QPP Control – Multiple Incidents Independently

QPP Control – Now What to Do?

Uh Oh!
I need More Water

Can I
Help?

Rosetta Stone – The QPP Framework

- The QPP Framework is a construct that
 - Allows engineers and first responders to talk about QPP without diving too deeply into each other area of expertise
 - Enables a way to describe network functionality
 - Describes what the network needs to know in order to make decisions in the rare cases that the network become overloaded with first responder traffic

The QPP Framework – At a High Level

- Every Cell Sector Across the Nation will be in one of three states
 - **Static** – The network will automatically apply QPP based on what has been pre-configured when provisioned
 - **Dynamic** – The network will accept input from First Responders to help mitigate congestion between First Responders.
 - **Controlled** – The network must have input to reduce congestion between First Responders.
- The network can also handle a man down or responder emergency situation at the same time
- When needed, the network will take resources from secondary users to give to first responders
